## Understanding of requirements

As a Zoho CRM user, I want a conversation component directly on the record page so that I can see the entire message history and continue the conversation without switching between modules.

### How does user benefits?

Keep customer details and conversations together, making it easier to engage in context.

### Business criticality

Manage customer interactions end-to-end from the record page

## Solution

---

# Conversation Component Integration — Zoho

## Overview

This document explains the **previous** and **latest approaches** used for embedding the **Conversation Component** inside Zoho records via a widget.

The Conversation Component enables users to view and manage SMS-Magic conversations linked to Zoho records.

---

## Previous Approach

### ♦ Flow Summary

In the earlier implementation, the Zoho widget handled both **authentication** and **conversation fetching** logic directly within the widget itself.

### Steps

#### 1. Widget Launch

- A **button** inside the Zoho record opens the **SMS-Magic widget**.
- The button triggers a **URL** containing parameters such as:

```
1 | /zoho-widget/widgets/conversation/index.html?phone_field={phone_field_api_name}
```

#### 2. Inside the Widget

- The widget performs the following actions sequentially:

- **Fetch Custom Variable**

```
1 | smsmagic4__User_Token
```

- **Fetch Current Zoho User ID** using Zoho SDK.

#### 3. Authentication

- The widget calls the backend authentication API:

```
1 | /api/v1/zoho/identity
```

to verify the Zoho user and obtain a session context.

#### 4. Fetch Record Details

- Using the `phone_field` passed in the URL, the widget fetches record details from Zoho.
- It extracts the **phone number** from the record.

#### 5. Fetch Latest Conversation

- Using the record's phone number, it calls:

```
1 | /api/v2/converse_desk/chat_widget_conversation?mobile_number={record_mobile}
```

to retrieve the latest conversation.

## 6. Load Conversation Component

- Once the conversation ID is retrieved, the widget loads and iframe:

```
1 | /fastapp/desk/#!/conversation?conversation_id={conversation_id}
```

- This displays the conversation component within the Zoho widget.

### ⚠ Limitations of Previous Approach

- Too much logic handled within the widget.
- Authentication, data fetch, and navigation tightly coupled.
- Hard to reuse across different Zoho modules or other integrations.
- High dependency on URL params (phone\_field).

---

## 🚀 Latest Approach

### ♦ Objective

Simplify the integration by **centralizing logic** in the **Conversation Component**, making it reusable across all integrations.

### ✚ Steps

#### 1. Widget Launch

- A **button** inside the Zoho record opens the SMS-Magic widget.
- No phone\_field parameters are passed via URL.

#### 2. Initial Data Fetch

- Inside the widget:
  - Fetch custom variable `smsmagic4__User_Token`
  - Fetch **current Zoho User ID** using Zoho SDK

#### 3. Server Authentication & Redirect

- The widget calls a new API that:
  - Accepts:
    - Redirect URL
    - Zoho User Token
    - Zoho User ID
  - Performs authentication on the server.
  - Returns a redirect to the **Conversation Component**:

```
1 | /fastapp/desk/#!/conversation?record_id={recordId}&module_name={moduleName}&crm=zoho
```

#### 4. Conversation Component

- The component receives:
  - `record_id`
  - `module_name`
  - `crm=zoho`
- Fetches all conversations for that record from the desk.
- Displays:
  - All existing conversations for that record.
  - Option to **create new conversations**.

#### 5. Create New Conversation

- The component fetches **phone fields** for that record.
- These phone fields are configured in the **Integration Tab**.
- The user can start a new conversation using any configured phone number.

#### ✓ Benefits of Latest Approach

- Centralized **conversation logic** within the Conversation Component.
- Widget only handles **authentication and record context**.
- Fully **reusable** across:
  - Zoho Recruit
  - Zoho Desk
  - Other CRMs or custom integrations
- Simplified and more secure authentication flow.
- Easier maintenance and future scalability.

#### Summary Comparison

| Aspect             | Previous Approach                      | Latest Approach                         |
|--------------------|----------------------------------------|-----------------------------------------|
| Authentication     | Done inside widget                     | Done via API and redirect               |
| Data Handling      | Phone field & record fetched in widget | Record, module, and CRM passed directly |
| Logic Distribution | Spread across widget & component       | Centralized in component                |

|                 |                             |                                 |
|-----------------|-----------------------------|---------------------------------|
| Reusability     | Limited to Zoho integration | Can be reused across platforms  |
| Maintainability | Complex                     | Simplified and modular          |
| CRM Context     | Not passed                  | Passed as <code>crm=zoho</code> |

---

### Key APIs

| API                                                         | Purpose                                                                                                                                        |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>/api/v1/zoho/identity</code>                          | Authenticate Zoho user                                                                                                                         |
| <code>/api/v2/converse_desk/chat_widget_conversation</code> | Fetch existing conversation by mobile number                                                                                                   |
| <code>/api/v1/redirect_auth</code> <i>(new)</i>             | Authenticate and redirect to Conversation Component with context ( <code>record_id</code> , <code>module_name</code> , <code>crm=zoho</code> ) |
